Recruiter Guide: My Projects Portfolio

Ali Ayhan Günder

June 28, 2026

This document is a quick tour of the repository and where to find the most relevant work.

Repository root: `My-Projects/`

Contents

1 Fast path (25 minutes)

If you only have a short amount of time, start with:

1. GENFIT (team full-stack SWE project): a fitness-themed platform built with documented setup.
Folder: `GENFIT_SWE_PROJECT_CMPE451_FINAL_VERSİON/`
Start here: `.../bounswe2025group2-main/bounswe2025group2-main/README.md`

2. Operating Systems (C / performance): systems programming projects.
Folder: `OPERATING_SYSTEM_PROJECTS/`

3. Statistics / analytics (Python): data analysis scripts and reports.
Folder: `STATISTICS_PROJECTS/`

2 How this repo is organized

Projects are grouped mostly by course or topic. The top-level README.md acts as a clickable index.

2.1 Main folders and what they contain

*** Software engineering (team)**
- `GENFIT_SWE_PROJECT_CMPE451_FINAL_VERSİON/`: Final iteration of our team project (full-stack).
- `GENFIT_SWE_PROJECT_V1_CMPE352/`: Earlier iteration of our team project (full-stack).

*** Systems & low-level**
- `OPERATING_SYSTEM_PROJECTS/`: C projects; some are best built/run on Linux/WSL (CMPE322).
- `COMPUTER_ORGANIZATION_LABS/`: Course labs (CMPE344).
- `System Programming_PROJECTS_C,C++,ASSEMBLY/`: C/C++/assembly low-level programming exercises.

*** Distributed systems**
- `DISTRIBUTED_SYSTEMS_CMPE476/`: Sockets and RPC systems programming coursework.

*** Algorithms & data structures**
- `ANALYSIS_OF_ALGORITHMS_PROJECTS/`: Course projects on design & complexity analysis (CMPE300).
- `DATA_STRUCTURES&ALGORİTMS/`: Fundamental structures and algorithms implementations.

*** Data**
- `DBMS_SQL_PROJECTS/`: SQL-focused database design and query projects.
- `STATISTICS_PROJECTS/`: Python statistics and data analytics scripts with reports.

*** System simulation & modeling**
- `SYSTEM_SIMULATION_IE306_projects/`: Discrete event simulations (inventory, clinic, ferry).
- `OPERATION_RESEARCH_PROJECTS_IE310/`: Optimization models and linear programming exercises.

*** Computational science & simulations**
- `PARTICLE_BASED_SIMULATIONS_CMPE_49G/`: Simulations of physical particle movements and interactions.

*** Signal processing**
- `SIGNAL&SYSTEMS_CMPE362_Projects/`: MATLAB and Python signal processing homeworks.

*** AI & healthcare**
- `AI_IN_HEALTCARE_CMPE49T/`: Deep learning applications and reports for healthcare data.

*** Languages / coursework**
- `JAVA_OOP_CMPE160/`: Java OOP projects (Ant Colony Optimization, Map Navigation).
- `PYTHON_PROJECTS_CMPE150/`: Introductory Python projects and tasks.
- `PRINCIPLES_OF_PROGRAMMING_LANGUAGES_CMPE 260-PROLOG/`: Logic programming, interpreters and parsing in Prolog.

*** HCI / UI**
- `HUMAN_COMPUTER_INTERACTİON_PROJECTS_CMPE496/`: UI/UX user studies and interface mockups.

*** Entrepreneurship / business**
- `Entrepreneurship_PROJECT&STARTUP_AD432/`: Pitch decks, business plans, and startup analysis.

3 How to review quickly (what to look for)

3.1 Code-first projects

* Look for a project-level README with setup steps.
* For C/C++ projects, check for a Makefile and a src/ folder.
* For Python projects, check for requirements.txt and runnable scripts (e.g., task1.py).

3.2 Report-first projects

* Some folders include PDFs (reports/specs). Opening the PDF first can be the fastest way to understand the goal and results.

4 Optional: running the highlight project (GENFIT)

The GENFIT repository contains detailed Docker instructions in its own README. In general terms, the flow is:

1. Install Docker + Docker Compose.
2. Follow the docker-compose commands in the project README.
